NOTE 8) BYTE1 (MSB): "11": unipolar 1V-1I system; "33": 3V-3I system without neutral informations; "34": 3V-4I system ----

BYTE0 (LSB): "00": if the active power flows in the normal/indicated direction ("upstream to downstream" or depending on the polarity indicated for the connection), "default"; "01": if the active power flows in reverse direction ("downstream to upstream" or on opposite direction compared to the connection polarity indicated)

NOTE 9) Expressed as a "numeric coding" with sign (always positive value, most significant bit = 0)

NOTE 10) Expressed as a "numeric coding" (most significant bit = sign)

NOTE 11) Measurement unit compatible with the value configured in the previous register, multiplied by the multiplication factor concerning that value.

NOTE 12) Register address (absolute value) of the desired value

NOTE 13) BIT 0 : 1= The event generates an alarm, 0 = The event doesn't generate an alarm

BIT 1 : 1 = The event generates a push&link action, 0 =The event doesn't generate a push&link action

NOTE 14) The value read in the register containing the measurement data is divided by the corresponding multiplication factor indicated in this register, if the register is not present, a multiplicative factor 1 has to be considered
 Example: I1 [A] = Phase 1 current value (R) / Current multiplier factor = 1023 / 100 = 10,23A
 The value can not be changed by the user
